

STM32U5 Nucleo-144 board (MB1549)

Introduction

The STM32U5 Nucleo-144 board based on the MB1549 reference board (order codes NUCLEO-U575ZI-Q and NUCLEO-U5A5ZJ-Q) provides an affordable and flexible way for users to try out new concepts and build prototypes by choosing from the various combinations of performance and power-consumption features provided by the STM32U5 microcontroller.

The ST Zio connector, which extends the ARDUINO[®] Uno V3 connectivity, and the ST morpho headers provide easy expansion of the functionality of the STM32 Nucleo open development platform with a wide choice of specialized shields.

The STM32U5 Nucleo-144 board does not require any separate probe as it integrates the STLINK-V3E debugger/programmer.

The STM32U5 Nucleo-144 board comes with the STM32 comprehensive free software libraries and examples available with the STM32CubeU5 MCU Package.

Figure 1. STM32U5 Nucleo-144 board

Picture is not contractual.

1 Features

- STM32U5 series microcontroller, featuring an Arm[®] Cortex[®]-M33 with Arm[®] TrustZone[®] in an LQFP144 package
- Internal SMPS to generate V_{core} logic supply, identified by '-Q' suffixed boards⁽¹⁾
- USB Type-C[®] sink device FS or HS depending on the microcontroller
- Three user LEDs
- · Reset and user push-buttons
- 32.768 kHz crystal oscillator
- Board connectors:
 - USB Type-C[®] connector
 - ST Zio connector including ARDUINO[®] Uno V3
 - ST morpho extension pin headers for full access to all STM32 I/Os
- Flexible power-supply options: ST-LINK USB V_{BUS}, USB connector, or external sources
- On-board STLINK-V3E debugger/programmer with USB re-enumeration capability: mass storage, Virtual COM port, and debug port
- Comprehensive free software libraries and examples available with the STM32CubeU5 MCU Package
- Support of a wide choice of Integrated Development Environments (IDEs) including IAR Embedded Workbench®, MDK-ARM, and STM32CubeIDE
- SMPS significantly reduces power consumption in Run mode, by generating a V_{core} logic supply from an internal DC-DC converter.

Note: Arm and TrustZone are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

2 Ordering information

To order an STM32U5 Nucleo-144 board, refer to Table 1. Additional information is available from the datasheet and reference manual of the target STM32.

Table 1. Ordering information

Order code	Board reference	Target STM32
NUCLEO-U575ZI-Q	MD4540(1)	STM32U575ZIT6Q
NUCLEO-U5A5ZJ-Q	MB1549 ⁽¹⁾	STM32U5A5ZJT6Q

^{1.} Subsequently called main board in the rest of the documentation.

2.1 Codification

The meaning of the codification is explained in Table 2.

Table 2. Codification explanation

NUCLEO-XXYYZT-Q	Description	Example: NUCLEO-U575ZI-Q
XX	MCU series in STM32 32-bit Arm Cortex MCUs	STM32U5 series
YY	MCU product line in the series	STM32U575/585
Z	STM32 package pin count	144 pins
Т	STM32 flash memory size: I for 2 Mbytes J for 4 Mbytes 2 Mbytes	
-Q	STM32 has an internal SMPS function	Internal SMPS

UM2861 - Rev 10 page 3/52

3 Development environment

3.1 System requirements

- Multi-OS support: Windows® 10, Linux® 64-bit, or macOS®
- USB Type-A or USB Type-C® to Micro-B cable

Note: macOS[®] is a trademark of Apple Inc., registered in the U.S. and other countries and regions.

Linux[®] is a registered trademark of Linus Torvalds.

Windows is a trademark of the Microsoft group of companies.

3.2 Development toolchains

- IAR Systems[®] IAR Embedded Workbench^{®(1)}
- Keil[®] MDK-ARM⁽¹⁾
- STMicroelectronics STM32CubeIDE
- 1. On Windows® only.

3.3 Demonstration software

The demonstration software, included in the STM32Cube MCU Package corresponding to the on-board microcontroller, is preloaded in the STM32 flash memory for easy demonstration of the device peripherals in standalone mode. The latest versions of the demonstration source code and associated documentation can be downloaded from www.st.com.

UM2861 - Rev 10 page 4/52

4 Conventions

Table 3 provides the conventions used for the ON and OFF settings in the present document.

Table 3. ON/OFF convention

Convention	Definition
Jumper JPx ON	Jumper fitted
Jumper JPx OFF	Jumper not fitted
Jumper JPx [1-2]	Jumper fitted between pin 1 and pin 2
Solder bridge SBx ON	SBx connections closed by 0 Ω resistor
Solder bridge SBx OFF	SBx connections left open
Resistor Rx ON	Resistor soldered
Resistor Rx OFF	Resistor not soldered
Capacitor Cx ON	Capacitor soldered
Capacitor Cx OFF	Capacitor not soldered

UM2861 - Rev 10 page 5/52

5 Safety recommendations

5.1 Targeted audience

This product targets users with at least basic electronics or embedded software development knowledge such as engineers, technicians, or students. This board is not a toy and is not suited for use by children.

5.2 Handling the board

This product contains a bare printed circuit board and like all products of this type, the user must be careful about the following points:

- The connection pins on the board might be sharp. Be careful when handling the board to avoid hurting yourself
- This board contains static-sensitive devices. To avoid damaging it, handle the board in an ESD-proof environment.
- While powered, do not touch the electric connections on the board with your fingers or anything conductive.
 The board operates at a voltage level that is not dangerous, but components might be damaged when shorted.
- Do not put any liquid on the board and avoid operating the board close to water or at a high humidity level.
- Do not operate the board if dirty or dusty.

UM2861 - Rev 10 page 6/52

6 Quick start

The STM32U5 Nucleo-144 board is a low-cost and easy-to-use development kit, to evaluate quickly and start development with an STM32U5 series microcontroller in an LQFP 144-pin package. Before installing and using the product, accept the evaluation product license agreement from the www.st.com/epla webpage. For more information on the STM32U5 Nucleo-144 board and software example, visit the www.st.com/stm32nucleo webpage.

6.1 Getting started

Follow the sequence below to configure the STM32U5 Nucleo-144 board and launch the software example (refer to Figure 4 for component location):

- 1. Check the jumper position on the board (refer to Default board configuration).
- 2. Connect the STM32U5 Nucleo-144 board to a PC with a USB cable (USB Type-A or USB Type-C® to Micro-B) through the USB connector (CN1) to power the board.
- 3. The 5V_PWR green (LD5) and COM (LD4) LEDs light up, and the green LED (LD1) blinks.
- 4. Press the blue user button (B1).
- 5. Observe how the blinking of the LEDs (LD1, LD2, and LD3) changes, according to the number of clicks on the button (B1).
- Download the software examples that help to use the STM32 Nucleo features. These are available on the www.st.com website.
- 7. Develop your application using the available examples.

6.2 Default board configuration

By default, the STM32U5 Nucleo-144 board is configured with VDD_MCU at 3.3 V. It is possible to configure the board with VDD_MCU at 1.8 V. Before switching to 1.8 V, ensure that the extension module and external shield connected to the Nucleo-144 board are 1.8 V compatible.

The default jumper configuration and voltage setting are shown in Table 4.

Table 4. Default jumper configuration

Jumper	Definition	Default position	Comment
JP1	STLK_NRST	OFF	STLINK-V3E is selected as the default debugger.
JP2	T_NRST	ON	RST connected between MCU target and debugger
JP4	VDD	[1-2]	VDD MCU voltage selection 3V3
JP5	I _{DD} measurement	ON	MCU VDD current measurement
JP6	5V power selection	[1-2]	5V from STLINK-V3E
JP7	UCPD_DBCC1	OFF	Refer to Section 7.11.2: UCPD.
JP8 UCPD_DBCC2		OFF	Refer to section Section 7.11.2: UCPD.

UM2861 - Rev 10 page 7/52

JP1 OFF JP6 [1-2] JP2 ON JP5 ON JP4 [1-2] RoHS, JP7 OFF JP8 OFF

Figure 2. Default board configuration

UM2861 - Rev 10 page 8/52

Table 5 explains the other jumper settings and configurations.

Table 5. Jumper configuration

Jumper	Definition	Setting ⁽¹⁾	Comment
JP1	0711/ 007	ON	Use to reset the STLINK-V3E MCU when an external debug probe is used.
JPT	STLK_RST	OFF	STLINK-V3E is selected as the default debugger.
		ON	STLINK-V3E can reset the target MCU.
JP2	T_NRST	OFF	STLINK-V3E cannot reset the target MCU. Configuration to use when an external debug probe is used.
		[1-2]	The VDD voltage selection is 3V3.
JP4	VDD voltage selection	[2-3]	The VDD voltage selection is 1V8.
31 4	VDD Voltage selection	OFF	No internal VDD power supply
		OFF	(External 3.3 or 1.8 V needed)
	I _{DD} measurement	ON	MCU is powered by the on-board power supplies.
JP5		OFF	Use an ammeter to measure the VDD_MCU power consumption, or connect a 3.3 or 1.8 V external source on pin 2 (STLINK-PWR tools with STM32CubeMonitor-Power or the ULPBench probe as an example).
		[1-2]	5V source from STLINK-V3E
		[3-4]	5V source from ARDUINO® VIN 7-12 V
		[5-6]	5V source from 5V_EXT
150		[7-8]	5V source from USB Type-C®
JP6	5V power selection ⁽²⁾		5V source from USB_CHGR.
		[9-10]	From the STLINK-V3E USB connector (CN1), without overcurrent protection.
		OFF	No 5V power source, configuration when external 3V3 is used.
ID7	UCPD_DBCC1	OFF	UCPD_DBCC1 NOT connected to GND
JP7		ON	UCPD_DBCC1 connected to GND (for debugging purpose)
IDO	UCPD_DBCC2	OFF	UCPD_DBCC2 NOT connected to GND
JP8		ON	UCPD_DBCC2 connected to GND (for debugging purpose)

^{1.} The default configuration is in bold.

UM2861 - Rev 10 page 9/52

^{2.} This is recommended to have only one jumper configuration.

7 Hardware layout and configuration

The STM32U5 Nucleo-144 board is designed around an STM32U5 microcontroller in an LQFP 144-pin package. Figure 3 shows the connections between the STM32 and its peripherals (STLINK-V3E, push-buttons, LEDs, USB ST Zio connectors, and ST morpho headers). Figure 4 and Figure 5 show the location of these features on the STM32U5 Nucleo-144 board.

The mechanical dimensions of the board are shown in Figure 6.

7.3 Embedded STLINK-V3E

The chapter below gives some information about the implementation of STLINK-V3E on this STM32U5 Nucleo-144 board. For detailed information about ST-LINK capabilities, LED management, driver, and firmware for this STLINK-V3E, refer to the technical note *Overview of ST-LINK derivatives* (TN1235).

For information about the debugging and programming features of STLINK-V3E, refer to the user manual STLINK-V3SET debugger/programmer for STM8 and STM32 (UM2448).

7.3.1 Description

There are two different ways to program or debug the onboard STM32 MCU.

- Using the embedded STLINK-V3E
- Using an external debug tool connected to the STDC14/MIPI10 connector (CN5)

Refer to Table 5 to switch between STLINK-V3E or STDC14 configuration.

The STLINK-V3E facility for debugging and flashing is integrated into the STM32 Nucleo-144 board. Features supported in STLINK-V3E:

- 5 V/500 mA power supplied by the USB connector (CN1)
- USB 2.0 high-speed compatible interface
- Serial Wire Debug (SWD) with Serial Wire Viewer (SWV)
- Virtual COM port (VCP)
- 1.7 to 3.6 V application voltage
- COM status LED that blinks during communication with the PC
- USB overcurrent protection (U2)

One tricolor LED (green, orange, and red) provides information about STLINK-V3E communication status (LD4). For detailed information about this LED, refer to the technical note *Overview of ST-LINK derivatives* (TN1235).

Table 6 describes the USB Micro-B connector (CN1) pinout.

Pin	Pin name	Signal name	STLINK-V3E STM32 pin	Function
1	1 VBUS 5V_USB_CHGR		-	VBUS power
2	DM	USB_DEV_HS_CN_N	PB14	DM
3	DP	USB_DEV_HS_CN_P	PB15	DP
4	4 ID - 5 GND GND		-	ID
5			GND	GND

Table 6. USB Micro-B connector (CN1) pinout

7.3.2 Drivers

The driver installation is not mandatory for Windows[®] 10 but allocates an ST-specific name to the ST-LINK COM port in the system device manager.

For detailed information regarding the ST-LINK USB driver, refer to the technical note *Overview of ST-LINK derivatives* (TN1235).

7.3.3 STLINK-V3E firmware upgrade

STLINK-V3E embeds a firmware upgrade (stsw-link007) mechanism through the USB port. As the firmware might evolve during the lifetime of the STLINK-V3E product, to add new functionalities, fix bugs, and support new microcontroller families, it is recommended to visit the *www.st.com* website before starting to use the STM32U5 Nucleo-144 board and periodically, to stay up-to-date with the latest firmware version.

For detailed information about firmware upgrades, refer to the technical note *Overview of ST-LINK derivatives* (TN1235).

UM2861 - Rev 10 page 14/52

7.3.4 Using an external debug tool to program and debug the on-board STM32

To support an external debug tool, set the jumper (JP1) to reset the STLINK-V3E to avoid I/O conflict, and remove the jumper (JP2) to avoid reset conflict. Then connect the external debug tool through the STDC14/MIPI10 debug connector (CN5).

When using the external debug connector (CN5), the user can supply the STM32U5 Nucleo-144 board with the STLINK-V3E connector (CN1) or select another power supply source as described in Power supply and power selection.

STLK_NRST (JP1 ON)

Figure 8 shows the STDC14/MIPI10 connector (CN5).

Figure 8. STDC14/MIPI10 debug connector (CN5)

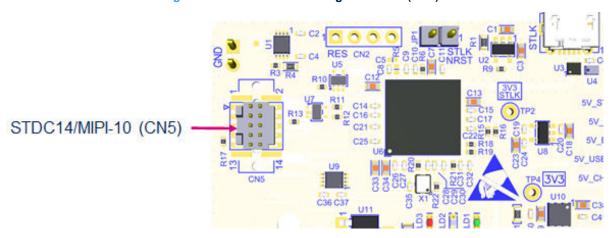

Table 7 describes the STDC14/MIPI10 connector (CN5) pinout.

Table 7. STDC14/MIPI10 debug connector (CN5) pinout

MIPI10 pin	STDC14 pin	CN5	Function
-	1	NC	Reserved ⁽¹⁾
-	2	NC	Reserved ⁽¹⁾
1	3	VDD	Target VDD ⁽²⁾
2	4	T_SWDIO	Target SWDIO using SWD protocol or target JTMS (T_JTMS) using JTAG protocol
3	5	GND	Ground
4	6	T_SWCLK	Target SWCLK using SWD protocol or target JTCK (T_JTCK) using JTAG protocol
5	7	GND	Ground
6	8	T_SWO	Target SWO using SWD protocol or target JTDO (T_JTDO) using JTAG protocol (SB44 ON)
7	9	NC	T_JRCLK ⁽³⁾ /NC ⁽⁴⁾
8	10	T_JTDI	Not used by SWD protocol, target JTDI (T_JTDI) using JTAG protocol, only for external tools (SB39 OFF)
9	11	GNDDetect	GND detection for plug indicator ⁽⁵⁾
10	12	T_NRST	Target NRST
-	13	T_VCP_RX	Target Rx used for VCP (with UART supporting bootloader) ⁽⁶⁾
-	14	T_VCP_TX	Target Tx used for VCP (with UART supporting bootloader)(2)

- 1. Do not connect to the target. It is not connected to the STM32U5 Nucleo-144 board.
- 2. Input for the external debug tools and output for the STM32U5 Nucleo-144 board.
- 3. Optional loopback of JTCK on the target side.
- 4. NC means not required for the SWD connection, not connected on the STM32U5 Nucleo-144 board.
- 5. Tied to GND. The target might use it for the detection of the tool.
- 6. Output for the external debug tools and input for the STM32U5 Nucleo-144 board.

Two level shifters are used on VCP and SWD interfaces to offer a debug capability with the MCU powered by a 1.8 V power source. The level shifters are used for signals from the target MCU (1.8/3.3 V) to STLINK-V3E (3.3 V).

UM2861 - Rev 10 page 16/52

7.4 Power supply and power selection

7.4.1 External power supply input

It is possible to configure the STM32U5 Nucleo-144 board to use any of the following power sources:

- 5V_STLK from STLINK-V3E USB connector (CN1)
- VIN (7-12 V) from ARDUINO®-included Zio connector (CN8) or ST morpho connector (CN11) with 5 V adaptation from LDO (U11)
- 5V EXT from ST morpho connector (CN11)
- 5V USB C from USB Type-C® connector (CN15)
- 5V_CHGR from STLINK-V3E USB connector (CN1)
- 3V3 from ARDUINO®-included Zio connector (CN8) or ST morpho connector (CN11)

If VIN, 5V_EXT, or 3V3 is used to power the STM32U5 Nucleo-144 board, this power source must comply with the EN 62368-1:2014+A11:2017 standard and must be safety extralow voltage (SELV) with limited power capability.

The power supply capabilities are summarized in Table 8.

Table 8. Power source capability

Input power name	Connector pins	Voltage range	Max. current	Limitation
5V_STLK	CN1 pin 1 JP6 [1-2]	4.75 to 5.5 V	500 mA	The maximum current depends on the presence or absence of USB enumeration: 100 mA without enumeration 500 mA with enumeration OK
VIN/5V_VIN	CN8 pin 15 CN11 pin 24 JP6 [3-4]	7 to 12 V	800 mA	From 7 to 12 V only and input current capability is linked to input voltage: 800 mA input current when VIN = 7 V 450 mA input current when 7 V < VIN < 9 V 250 mA input current when 9 V < VIN < 12 V
5V_EXT	CN11 pin 6 JP6 [5-6]	4.75 to 5.5 V	500 mA	The maximum current depends on the power source.
5V_USB_C	CN15 JP6 [7-8]	4.75 to 5.5 V	1 A	The maximum current depends on the USB host used to power the Nucleo.
5V_CHGR	CN1 pin 1 JP6 [9-10]	4.75 to 5.5 V	500 mA	The maximum current depends on the USB wall charger used to power the Nucleo. There is no USB enumeration.
3V3	CN8 pin 7 CN11 pin 16 JP5 pin 2	3.0 to 3.6 V	-	The maximum current depends on the 3V3 source. The 3V3 can be used when the STLINK-V3E part of the PCB is not used. SB1 must be OFF to protect LDO (U10).
VDD	JP4 pin 2	1.71 to 3.6 V	-	It is possible to power only the MCU power supply pins by applying a voltage source on JP4 pin 2. In this case, only the MCU is powered. External functions like debugging, LED, or the expansion connector are not powered. This option can be used for the MCU power consumption measurement.

UM2861 - Rev 10 page 17/52

5V_STLK is a 5V DC power with limitations from the STLINK-V3E USB connector (CN1). In this case, the 5V jumper selection (JP6) must be on pin [1-2] to select the 5V_STLK power source on the JP6 connector. This is the default setting. If the USB enumeration succeeds, the 5V_STLK power is enabled, by asserting the T_PWR_EN signal from STLINK-V3E. This pin is connected to a power switch (U2) with the management of the maximum current delivery.

The STM32U5 Nucleo-144 board and its shield can be powered from the STLINK-V3E USB connector (CN1), but only the STLINK-V3E circuit is powered before USB enumeration because the host PC only provides 100 mA to the board at that time. During the USB enumeration, the STM32U5 Nucleo-144 board requests 500 mA power to the host PC.

- If the host can provide the required power, the U2 power switch is enabled, the green LED (LD5) is turned ON, and the STM32U5 Nucleo-144 board and its shield can consume up to 500 mA.
- If the host is not able to provide the requested current, the enumeration fails. The U2 power switch remains OFF and the MCU part including the extension board is not powered. As a consequence, the green LED (LD5) remains OFF. In this case, it is recommended to use an external power supply.

5V STLK configuration: 5V jumper selection JP6[1-2] must be connected as shown in Figure 9.

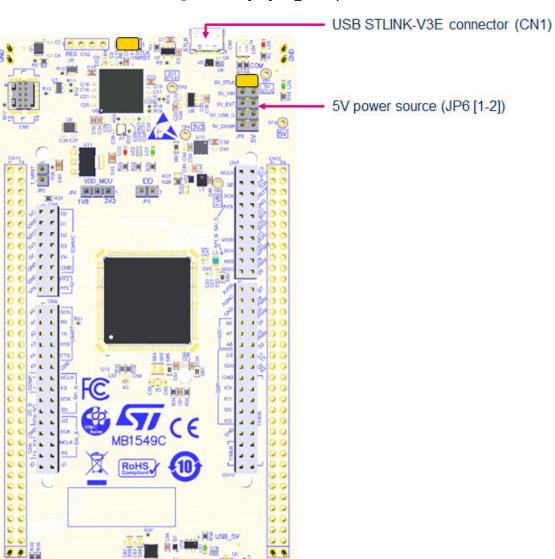

Figure 9. JP6 [1-2]: 5V_STLK power source

UM2861 - Rev 10 page 18/52

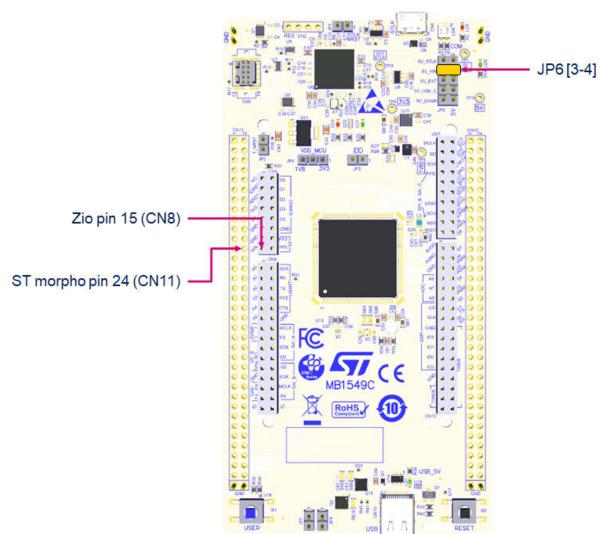

VIN (**5V_VIN**) is the 7 to 12 V DC power source from the ARDUINO[®] included Zio connector (CN8) pin 15 (VIN), or from the ST morpho connector (CN11) pin 24. The 5V jumper selection (JP6) must be on pin [3-4] to select the 5V_VIN power source. In that case, the DC power can come from the ARDUINO[®] Uno V3 battery shield (compatible with the Adafruit PowerBoost 500 shield).

An LDO (U11) is used to provide a fixed 5 V from VIN (7-12 V).

5V_VIN configuration: 5 V jumper selection (JP6) [3-4] must be connected as shown in Figure 10.

Figure 10. JP6 [3-4]: 5V_VIN power source

UM2861 - Rev 10 page 19/52

5V_EXT is the DC power coming from an external 5 V DC power source from the ST morpho connector (CN11) pin 6. The 5V jumper selection (JP6) must be on pin [5-6] to select the 5V_EXT power source on the JP6 connector, and must be connected as shown in Figure 11.

JP6 [5-6] ST morpho pin 6 (CN11)

Figure 11. JP6 [5-6]: 5V_EXT power source

UM2861 - Rev 10 page 20/52

5V_USB_C is the DC power source coming from the 5V USB connector (CN15). The 5V jumper selection (JP6) must be set on [7-8] and must be connected as shown in Figure 12.

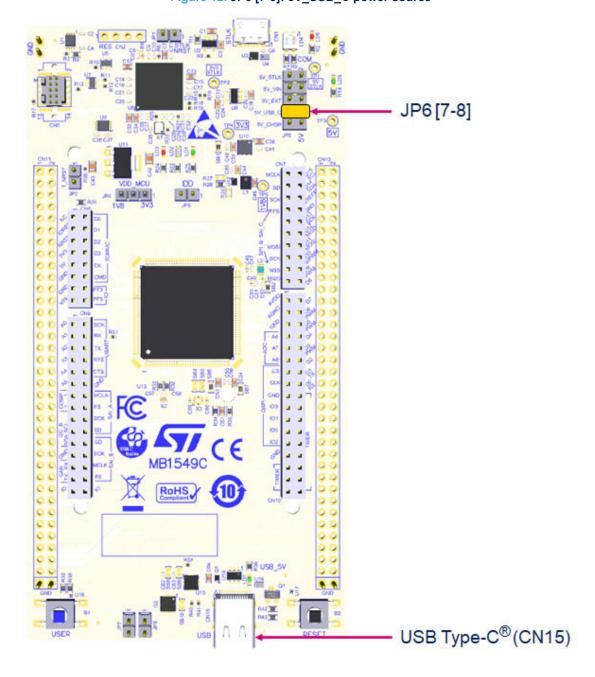

Figure 12. JP6 [7-8]: 5V_USB_C power source

5V_CHGR is when a DC power charger is connected to the USB STLINK-V3E connector (CN1). To select the 5V_CHGR power source, the 5V jumper selection (JP6) must be between pins [9-10]. If an external USB charger powers the STM32U5 Nucleo-144 board, then the debugging feature through (CN1) is not available. If a host computer is connected instead of the charger, the current limitation is no longer effective. In this case, the host computer can be damaged, and it is recommended to select 5V_STLK mode.

UM2861 - Rev 10 page 21/52

5V_CHGR configuration: 5V jumper selection JP6[9-10] should be connected as shown in Figure 13.

USB STLINK-V3E (CN1) JP6 [9-10]

Figure 13. JP6 [9-10]: 5V_CHGR power source

Note:

With this JP6 configuration, the USB_PWR protection is bypassed. This configuration is forbidden to power the board with a computer USB port, as the USB_PWR_protection is bypassed. The reason is that if the board consumes more than 500 mA, it can damage the computer.

External 3V3 power supply input. In some situations, it is interesting to use an external 3.3 V source on the 3V3 input (CN8 pin 7 or CN11 pin 16), for instance in case the 3.3 V is provided by an extension board. When the Nucleo-144 is powered with only a 3.3V source, the STLINK-V3E part is not powered, thus programming and debugging are unavailable.

When using the 3V3 input, the STLINK-V3E part is not supplied.

For this configuration, it is recommended to remove SB1 to avoid backward voltage to 5 V through U10, and remove JP2 to avoid STM32 MCU reset from the STLINK-V3E part.

UM2861 - Rev 10 page 22/52

VDD power supply input. In some situations, it is interesting to use an external power source from 1.71 to 3.6 V to power only the MCU power supply pins (JP4 pin 2 or JP5 pin 2). In this configuration, external functions like debugging, LED, or the expansion connector are not powered. This option can be used for the optimized MCU power consumption measurement.

7.4.2 Programing/debugging when the power supply is not from STLINK-V3E (5V_STLK)

In case the current consumption of the Nucleo-144 and the expansion boards exceeds the allowed current on the ST-LINK USB connector, the external power 5V_VIN, 5V_EXT, or 5V_USB_C can be used. In such a case, it is still possible to use the embedded ST-LINK for VCP programming and debugging.

In this case, the following power sequence procedure must be respected:

- 1. Connect the JP6 jumper according to the 5V selected external power source.
- Connect the external power source according to JP6.
- 3. Power on the external power supply.
- 4. Check that the 5 V green LED (LD5) is turned ON.
- 5. Connect the PC to the USB connector (CN1) for programming/debugging.

If this sequence is not respected, V_{BUS} from STLINK-V3E might first power the board, and the following risks might be encountered:

- If the board needs more than 500 mA current, the PC might be damaged or can limit the current. Therefore, the board is not powered correctly.
- Enumeration requests 500 mA, so there is a risk that the request is rejected and enumeration does not succeed if the PC cannot provide such a current. Consequently, the board is not powered (LD5 LED remains OFF).

7.4.3 Power supply output

- **5V**: Whatever the power source (5V_STLK, 5V_VIN, 5V_EXT, 5V_CHGR, or 5V_USB_C) is, the generated 5 V is present on CN8 pin 9 or CN11 pin 18 and can be used as an output power supply for an ARDUINO® shield or an extension board. In this case, the maximum current of the power source specified in Table 8 needs to be respected.
- **3V3**: The internal 3V3, on CN8 pin 7 or CN11 pin 16, can be used also as a power supply output. The current is limited by the maximum current capability of the U10 regulator (500 mA including the Nucleo and shield boards consumption).

7.4.4 Internal power supply

The Nucleo boards are designed to support two specific voltage configurations:

- VDD at 3.3 V configuration to reach Nucleo-144 low-power mode
- VDD at 1.8 V configuration to demonstrate MCU low-voltage capability

7.4.4.1 3V3

Regardless of the 5 V power source, an LDO is used to deliver a fixed 3.3 V power voltage from 5 V. The maximum current capability of this source is 500 mA. To select the 3.3V voltage for the VDD, set the VDD jumper (JP4) on [1-2].

A solder bridge (SB1) is used to disconnect the LDO output, when an external 3.3 V is applied to the Nucleo-144 board, to avoid backward voltage to 5 V through this LDO.

- SB1 ON: U10 LDO output provides a 3V3 power supply (default configuration).
- SB1 OFF: U10 LDO output does not provide 3V3. An external 3.3 V power source is needed.

7.4.4.2 1V8

An external SMPS can be used for the MCU to work at 1.8 V. The external SMPS capability is 400 mA maximum. Before using the 1.8 V voltage, it is necessary to check that all interfaces connected to the Nucleo-144 board are 1.8 V compatible. To select the 1.8 V for the VDD, set the VDD jumper (JP4) on [2-3].

In this mode, it is possible to keep some MCU voltage domain at 3V3 depending on the application use case. The MCU voltage selection is done according to the solder bridge configuration. Refer to Table 9 for solder bridge configuration.

UM2861 - Rev 10 page 23/52

7.4.4.3 JP4 VDD voltage selection 1V8/3V3

The JP4 jumper selects the VDD voltage:

- Set JP4 on [1-2] to set VDD to 3V3.
- Set JP4 on [2-3] to set VDD to 1V8.

The consumption on this jumper includes the MCU power pins connected to the VDD_MCU power line and the other features supplied by VDD, such as the level shifter power supply pins for STLINK-V3E, the user button, the ARDUINO® shield on the IOREF pin, and the power supply pins on the ST morpho connector.

7.4.5 MCU power supply

The default configuration of the MCU power pins is described in Table 9.

Table 9. MCU power supplies

Solder bridge configuration	MCU power supply	
JP4 [1-2]/JP4 [2-3]	VDD selection: Jumper selection for VDD 3V3/1V8	
JP5 [1-2]/ammeter	I _{DD} : JP5 ON to supply the MCU or connected with an ammeter to do the current measurement.	
SB2 ON	SB for VDDSMPS input voltage	
SB3 ON	SB for VREFP input voltage	
SB30 ON	SB for VDDUSB input voltage	
	SB for VDDIO2 PG[2-15] input voltage	
SB28 ON/SB29 OFF	SB28 ON/SB29 OFF: VDDIO follows 1V8 to 3V3 VDD_MCU.	
	SB28 OFF/SB29 ON: VDDIO fixed to 3V3 whatever the VDD-MCU voltage is.	
SB50 ON SB for VBAT input voltage		
	SB for VDDA/VREF input voltage	
SB55 OFF/SB54 ON	SB55 ON/SB54 OFF: VDDA/VREF follows 1V8 to 3V3 VDD_MCU.	
3000 OFF/3004 ON	SB55 OFF/SB54 ON: VDDA/VREF fixed to 3V3 whatever the VDD-MCU voltage is.	
	For more details about the VDDA/VREFP power supply, refer to the MCU datasheet.	

Warning:

On this Nucleo-144, the power-on sequence implementation for the 1.8 V use case is given as an example and might not follow the recommended power-on sequencing. Refer to the application note Getting started with STM32U5 MCU hardware development (AN5373) and STM32U5xx products datasheets for power-on sequencing.

INTERNAL VCORE SMPS power supply

Power figures in run mode are significantly improved, by generating a V_{core} logic supply from the internal DC-DC converter (this function is only available on '-Q' suffixed boards).

For all general information concerning design recommendations for STM32U5 with internal SMPS and design guide for ultra-low-power applications with performance, refer to the application note *Getting started with STM32U5 MCU hardware development* (AN5373) at the *www.st.com* website.

UM2861 - Rev 10 page 24/52

7.4.6 VDD_MCU I_{DD} measurement

The labeled I_{DD} jumper (JP5) is used to measure the consumption of the STM32 microcontroller by removing the jumper and by connecting an ammeter or any other current measurement tool.

- Jumper ON: The STM32 microcontroller is powered (default).
- Jumper OFF: An ammeter or external 3V3 power source must be connected to power the STM32 microcontroller and measure its current consumption.

The Ipp jumper allows the current measurement for both 3V3 and 1V8 MCU voltage ranges.

7.5 LEDs

User green LED (LD1)

The user green LED (LD1) is connected to the PC7 STM32 I/O (SB21 ON and SB23 OFF, default configuration) or PA5 (SB21 OFF and SB23 ON, optional configuration corresponding to the D13 ST Zio connector). A transistor is used to drive the LED whatever the MCU 1.8/3.3 V voltage range.

User blue LED (LD2)

The user blue LED (LD2) is connected to PB7. A transistor is used to drive the LED whatever the MCU 1.8/3.3 V voltage range.

User red LED (LD3)

The user red LED (LD3) is connected to PG2. A transistor is used to drive the LED whatever the MCU 1.8/3.3 V voltage range.

These user LEDs are ON when the I/O is in the HIGH state, and are OFF when the I/O is in the LOW state.

COM tricolor LED (LD4)

The tricolor (green, orange, and red) LED (LD4) provides information about STLINK-V3E communication status. For detailed information about this LED, refer to the technical note *Overview of ST-LINK derivatives* (TN1235).

Green PWR LED (LD5)

The green LED (LD5) indicates that the Nucleo-144 is powered by a 5 V source, and this source is available on CN8 pin 9 and CN11 pin 18, but also for the LDO and external SMPS input.

Red STLINK-V3E USB OC power switch fault LED (LD6)

The red LED (LD6) indicates that the board power consumption on the USB exceeds 500 mA.

- If 500 mA or more is expected, the board must be supplied by one of the external 5 V sources compatible
 with more than 500 mA capability.
- If more than 500 mA is not expected, the board must be analyzed to understand the extra consumption.

USB Type-C[®] green LED (LD7)

The presence of the 5 V on the USB Type-C® user connector drives the green LED (LD7). Refer to USB Type-C® FS/HS for more details.

UM2861 - Rev 10 page 25/52

7.6 Push-buttons

Two buttons are available on the Nucleo board.

User button (B1)

The blue button for the user and wake-up functions is connected to PC13 to support the default TAMPER function or to PA0 to support the optional wake-up function of the STM32 microcontroller. When the button is pressed the logic state is HIGH, otherwise, the logic state is LOW.

- To connect the USER button to PC13, SB58 must be ON and SB59 must be OFF. This is the default configuration.
- To connect the USER button to PA0, SB58 must be OFF and SB59 must be ON. This is the optional configuration.

Buttons are implemented using a hardware debounce filter combined with a serial resistor to avoid damaging the STM32 GPIO in case of the wrong GPIO setting. A 0 Ω resistor can replace this 330 Ω serial resistor (R39) assuming the GPIO configuration is properly done. The hardware debounce filter is composed of a 100 nF capacitor (C84) with a 100 k Ω pull-down resistor (R38). Both components can be removed to reduce the BOM cost assuming the firmware handles debounce.

Warning:

The PC13 I/O used for the user button must be set to INPUT, pull-down (PD) with debouncing. Never set the PC13 to OUTPUT/LOW level to avoid a shortcut when the user button is pressed.

Reset button (B2)

The black button connected to NRST is used to reset the STM32 microcontroller. When the button is pressed the logic state is LOW, otherwise, the logic state is HIGH.

The blue and black plastic hats placed on these push-buttons can be removed if necessary, when a shield or an application board is plugged into the top of the Nucleo board. This avoids pressure on the buttons and consequently a possible permanent target MCU reset.

UM2861 - Rev 10 page 26/52

7.7 OSC clock sources

Three clock sources are described below:

- LSE is the 32.768 kHz crystal for the STM32 embedded RTC.
- MCO is the 8 MHz clock from STLINK-V3E MCU for the STM32 microcontroller.
- HSE is the 16 MHz oscillator for the STM32 microcontroller. This clock is available depending on the target STM32 series microcontroller used on the Nucleo-144 board.

7.7.1 LSE: OSC 32 KHz clock supply

There are three ways to configure the pins corresponding to the low-speed clock (LSE):

LSE on-board oscillator X2 crystal (default configuration)

To help select the crystal and its associated capacitors, refer to the application note *Oscillator design guide for STM8AF/AL/S, STM32 MCUs and MPUs* (AN2867).

As an example, this crystal might have the following characteristics: 32.768 kHz, 9 pF, and 20 ppm.

In this case, configure the board as follows:

- R32 and R33 ON
- SB51 and SB52 OFF

External oscillator connected to PC14 input

From the external oscillator through pin 25 of the ST morpho connector (CN11). The following configuration is needed:

- R32 and R33 OFF
- SB51 and SB52 ON, for connection from Zio connector CN11 pin 25

LSE not used

PC14 and PC15 are used as GPIOs instead of low-speed clocks. The following configuration is needed:

- R32 and R33 OFF
- SB51 and SB52 ON

UM2861 - Rev 10 page 27/52

7.7.2 OSC clock supply

There are four ways to configure the pins corresponding to the external high-speed clock (HSE):

HSE: on-board oscillator crystal (X3) (configuration depends on the embedded STM32U5 series microcontroller)

To help select the crystal and its associated capacitors (C59, C60), refer to the application note *Oscillator design guide for STM8AF/AL/S, STM32 MCUs and MPUs* (AN2867).

As an example, this crystal might have the following characteristics: 16 MHz, 8 pF, and 20 ppm.

In this case, configure the board as follows:

- SB47 and SB49 OFF. PH0 and PH1 are not connected to CN11 as I/Os.
- SB48 (MCO) OFF
- SB4 and SB5 ON are connected to the external HSE.

MCO from STLINK-V3E (default: not connected):

The MCO output of the STLINK-V3E MCU is used as an input clock. The frequency might be changed during the ST-LINK firmware upgrade (stsw-link007). It is fixed at 8 MHz by default and connected to PH0 OSC_IN of the STM32 microcontroller. To use this clock source, the following configuration is needed:

- SB47 OFF and SB49 ON. Only PH1 can be connected to CN11 as an I/O.
- SB48 ON. MCO is connected to PH0 and R5 on the STLINK-V3E side and must be connected to provide the MCO to the STLINK-V3E output.
- SB4 and SB5 OFF. The external crystal is not connected to HSE.
- The resistor (R5) and capacitor (C5) can be adapted for the 8 MHz shape.

External oscillator to PH0 (default: not connected)

The input clock comes from an external clock through PH0, on expansion connector (CN11) pin 29. The following configuration is needed:

- SB47 and SB49 ON. PH0 and PH1 are connected to CN11. PH1 can be used as a GPIO.
- SB48 OFF. MCO is not connected to PH0.
- SB4 and SB5 OFF. The external crystal (X3) is disconnected from PH0 and PH1.

HSE not used (configuration depends on the embedded STM32U5 series microcontroller)

PH0 and PH1 are used as GPIOs instead of crystal inputs. The following configuration is needed:

- SB47 and SB49 ON. PH0 and PH1 are connected to the expansion connector (CN11) as GPIOs.
- SB48 OFF. MCO is not connected to PH0.
- SB4 and SB5 OFF. The external crystal (X3) is disconnected from PH0 and PH1.

7.8 Reset sources

The reset signal of the Nucleo board is active LOW and the reset sources come from:

- The RESET button (B2),
- The embedded STLINK-V3E,
- The ARDUINO®-included Zio connector CN8 pin 5,
- Or the ST morpho connector CN11 pin 14.

UM2861 - Rev 10 page 28/52

7.9 Virtual COM port (VCP)

An STM32 serial interface is connected to the STLINK-V3E debug interface. The user can choose between a USART or an LPUART interface.

The selection between USART and LPUART is performed by setting related solder bridges.

Refer to the tables below to set the USART or LPUART connection to the VCP interface.

Table 10. USART1 connection

Solder bridge configuration ⁽¹⁾	Feature
SB32, SB34 ON SB24 SB26 SB31 SB33 OFF	USART1 (PA9/PA10) connected to STLINK-V3E VCP
SB31, SB33 ON SB25 SB27 SB32 SB34 OFF	USART1 (PA9/PA10) connected to Zio, ARDUINO® Uno V3 D0/D1

^{1.} The default configuration is in bold.

Table 11, LPUART1 connection

Solder bridge configuration ⁽¹⁾	Feature
SB25, SB27 ON SB24 SB26 SB31 SB33 OFF	LPUART1 (PG7/PG8) connected to Zio, ARDUINO® Uno V3 D0/D1
SB24, SB26 ON SB25 SB27 SB32 SB34 OFF	LPUART1 (PG7/PG8) connected to STLINK-V3E VCP.

^{1.} The default configuration is in bold.

By default:

- Serial communication between the target MCU and ST-LINK MCU is enabled on USART1 because this
 interface supports the bootloader mode.
- Serial communication between target MCU, ARDUINO[®] Uno V3, and ST morpho connectors is enabled on LPUART1, not to interfere with the VCP interface.

PG7 and PG8 are also connected to the ST morpho connector CN12 pins 66 (SB72) and 67 (SB73). The two solder bridges can be removed in case of conflict between ARDUINO® Uno V3 and ST morpho for PG7 or PG8.

7.10 Bootloader

The bootloader is located in the system memory, programmed by ST during production. It is used to reprogram the flash memory via USART, I²C, SPI, CAN FD, or USB FS in device mode through the device firmware upgrade (DFU). The bootloader is available on all devices. Refer to the application note *STM32 microcontroller system memory boot mode* (AN2606) for more details.

The Root secure services (RSS) are embedded in a flash area named the secure information block, programmed during ST production. For example, it enables secure firmware installation (SFI), thanks to the RSS extension firmware (RSSe SFI). This feature allows customers to protect the confidentiality of the firmware to be provisioned into the STM32 when production is subcontracted to an untrusted third-party. The Root secure services are available on all devices, after enabling the TrustZone® through the TZEN option bit.

The I/O PH3_BOOT0 gives external hardware access to the bootloader.

By default, this pin is set to level LOW by a pull-down resistor, to boot on the internal flash memory. It is possible to put this GPIO to level HIGH to boot on the system flash memory (bootloader), by connecting a 2.54-mm pitch jumper between the ST morpho connector (CN11) PH3_BOOT0 pin 7 and VDD pin 5.

As mentioned above, USART1 on PA9/PA10 is connected by default because this interface supports the bootloader mode.

UM2861 - Rev 10 page 29/52

7.11 USB Type-C[®] FS/HS

The STM32 Nucleo-144 board supports a USB interface. The USB connector (CN15) is a USB Type-C[®] connector.

This USB interface can be full speed (FS) or high speed (HS) depending on the embedded STM32U5 series microcontroller.

The NUCLEO-U575ZI-Q board embeds a USB full-speed (FS) interface and the NUCLEO-U5A5ZJ-Q board embeds a USB high-speed (HS) interface.

The STM32 Nucleo-144 board supports USB Type-C® sink power mode only.

The USB power green LED (LD7) lights up when V_{BUS} is powered by a USB Host and the Nucleo-144 board works as a USB Device.

7.11.1 USB FS/HS device

With a USB stack inside the STM32 and when a USB host connection to the USB Type- C^{\otimes} connector (CN15) of the STM32 Nucleo-144 is detected, the STM32 Nucleo-144 board can be a USB device. Depending on the powering capability of the USB host, the V_{BUS} terminal (CN15) can power the board. In the board schematic diagrams, the corresponding power voltage line is called 5V_UCPD. The STM32 Nucleo-144 board supports a 5 V USB voltage from 4.75 to 5.5 V. MCU VDD_USB supports the 3V3 power source only. Section 7.4 provides information on how to use the powering options. The hardware configuration for the USB interface is shown in Table 12.

I/O	Solder bridge	Setting	Configuration ⁽¹⁾
		OFF	PA11 is used as the USB_FS_N diff pair interface. No more multiplexing.
PA11	SB40	ON	PA11 can be used as a USB data interface and is also available on the ST morpho connector.
		ON	USB function is usable, but the track length to the expansion connector can impact performance due to impedance mismatch.
	PA12 SB41	OFF	PA12 is used as a USB_FS_P diff pair interface. No other multiplexing.
PA12			PA12 can be used as a USB data interface and is also available on the ST morpho connector.
		ON	USB function is usable, but the track length to the expansion connector can impact performance due to impedance mismatch.

Table 12. Hardware configuration for the USB interface

7.11.2 UCPD

The USB Type-C[®] introduces the USB Power Delivery feature. The STM32 Nucleo-144 implementation for the USB Power Delivery supports the dead battery and the sink mode with 5 V and 0.5 A (2.5 W).

In addition to the I/O DP/DM directly connected to the USB Type-C® connector, five I/Os are also used for UCPD configuration: configuration channel (CCx), VBUS-SENSE, UCPD dead battery (DBn), and UCPD_FAULT (FLT) feature.

To protect the STM32 Nucleo-144 from USB overvoltage, an STMicroelectronics Programmable Power Supply (PPS) compliant USB Type- $C^{\textcircled{\tiny{\$}}}$ port protection is used.

- Configuration Channel I/O: UCPD_CCx: These signals are connected to the associated CCx line of the
 USB Type-C[®] connector through the USB port protection. These lines are used for the configuration
 channel lines (CCx) to select the USB Type-C[®] current mode. The STM32 Nucleo-144 supports only sink
 current mode.
- Dead battery I/O: UCPD_DBn: This signal is connected to the associated DBn line of the USB port
 protection, which internally manages the dead battery resistors.

UM2861 - Rev 10 page 30/52

^{1.} The default configuration is shown in bold.

V_{BUS} fault detection: UCPD_FLT: This signal is provided by the USB Type-C[®] port protection. It is used as a fault reporting to the MCU after a bad V_{BUS} level detection. By design, the STM32 Nucleo-144 V_{BUS} protection is set to 6 V maximum. (R41 is set to 2K7 to select 6 V maximum).

For more details about UCPD with the USB Type-C[®] port protection for sink application, refer to the application note *USB Type-C Power Delivery using STM32 MCUs and MPUs* (AN5225) related to USB Type-C[®] power delivery using the STM32xx series.

Table 13 describes the hardware configuration for the UCPD feature.

Table 13. Hardware configuration for the UCPD feature

I/O	Solder bridge	Setting	Configuration ⁽¹⁾				
	SB42	OFF	PA15 not connected to USB Type-C [®] port protection and used as T_JTDI (optional configuration with SB39)				
PA15	3042	ON	PA15 connected to USB Type- C^{\otimes} port protection and NOT used as T_JTDI				
FAIS	SB8	OFF	PA15 connected to USB Type-C [®] port protection and used as UCPD_CC1				
	350	ON	PA15 directly connected to USB Type- ${\rm C^{\small 8}}$ connector. USB Type- ${\rm C^{\small 8}}$ port protection is bypassed.				
PB15	SB9	OFF	PB15 connected to USB Type-C [®] port protection and used as UCPD_CC2				
PBIS	209	ON	PB15 directly connected to USB Type-C [®] connector. USB Type-C [®] port protection is bypassed.				
PC2	SB6	ON	PC2 used as VBUS_SENSE				
PG2	380	OFF	PC2 NOT used for UCPD. It can be used on the Zio connector (SB53)				
	SB46 JP8	ON	IO UCPD_DBn connected to USB Type-C® port protection and used as a dead battery feature				
PB5		OFF	PB5 not used for UCPD_DBn can be used as SAI or SPI on Zio connector				
1 55		ON	UCPD_DBCC1 connected to GND (only for internal UCPD debug purpose)				
	JFO	OFF	UCPD_DBCC1 not connected to GND, can be used for Zio connector				
	SB45	ON	IO UCPD_FLT connected to USB Type-C $^{\! \otimes}$ port protection and used as overvoltage fault reporting to MCU				
PB14	3043	OFF	PB14 not used for UCPD_FLT can be used on the ST morpho connector				
1 514	ID7	ON	UCPD_DBCC2 connected to GND (only for internal UCPD debug purpose)				
	JP7 OFF		UCPD_DBCC2 not connected to GND, can be used for the ST morpho connector				

^{1.} The default configuration is shown in bold.

8 Extension connectors

Six extension connectors are implemented on the STM32U5 Nucleo-144 board:

- Zio connectors (CN7, CN8, CN9, and CN10) supporting ARDUINO[®] Uno V3
- ST morpho connectors (CN11 and CN12)

8.1 Zio connectors supporting ARDUINO® Uno V3

The Zio connectors (CN7, CN8, CN9, and CN10) are female connectors supporting the ARDUINO® Uno V3 standard. Most shields designed for ARDUINO® can fit the Nucleo board.

Caution:

Most of the STM32 microcontroller I/Os are 5 V-tolerant, but few of them are only 3V3-compatible, while $ARDUINO^{\circledR}$ Uno V3 is 5 V-compatible. Refer to the STM32U5 series data brief and STM32U5xx product datasheets for their I/O structure.

^{1.} The default configuration for the D0/D1 signal is LPUART1 on PG7 and PG8, USART1 on PA9 and PA10 is connected by default on STLINK-V3E.

UM2861 - Rev 10 page 35/52

- 2. PG2 to PG15 can have a different I/O level from other I/Os because supplied by VDDIO.
- 3. I/O shared between ADC and OCTOSPI (exclusive)
- 4. I/O shared between OCTOSPI and motor control (exclusive)
- 5. I/O shared between SAI_D, SPI_B, and UCPD function (exclusive)
- 6. I/Os are shared between SAI and JTAG SWO (exclusive).
- 7. SAI_D and SAI_B groups are on the same SAI instance (exclusive).
- 8. The SAI_D group is shared with the SPI_B group (exclusive).

Note: The OCTOSPI interface is used in quad-mode communication without DQS to support Quad-SPI memories.

UM2861 - Rev 10 page 36/52

8.2 ST morpho headers (CN11 and CN12)

The ST morpho consists of CN11 and CN12 male pin header footprints (not soldered by default). They can be used to connect the STM32 Nucleo-144 board to an extension board or a prototype/wrapping board placed on top of the STM32 Nucleo-144 board. All signals and power pins of the STM32 are available on the ST morpho connector. An oscilloscope, a logic analyzer, or a voltmeter can also probe this connector.

ST morpho pin header (CN11)

RoHS

Figure 16. ST morpho connector

Table 19 shows the pin assignments for the STM32 on the ST morpho connector.

- 1. The default state of BOOT0 is 0. It can be set to 1 when a jumper is plugged into pins 5-7 of CN11.
- 2. V_{REFP} is not connected to CN12 by default (SB20 OFF).
- 3. 5V_STLK is the 5V power signal, coming from the STLINK-V3E USB connector. It rises before the 5V signal of the board.
- 4. PA13 and PA14 are shared with SWD signals connected to STLINK-V3E.
- 5. PG2 to PG15 can be set to different I/O levels, thanks to the SB selecting the source for VDDIO2.

UM2861 - Rev 10 page 38/52

8.3 Solder bridge configuration for the expansion connector

Table 20 details the solder bridges of the STM32U5 Nucleo-144 board for the expansion connector.

Table 20. Solder bridge configuration

Definition	Bridge	Setting ⁽¹⁾	Comment
	CD4C	OFF	IOREF is not connected to the 1V8 power supply.
	SB16	ON	IOREF is connected to the 1V8 power supply.
IODEE - alsotion	0047	OFF	IOREF is not connected to the VDD power supply.
IOREF selection	SB17	ON	IOREF is connected to the VDD power supply.
	SB18	OFF	IOREF is not connected to the 3V3 power supply.
	3010	ON	IOREF is connected to the 3V3 power supply.
	SB19	OFF	PC8 is not connected to ST morpho CN12 pin 2 to avoid stub on Zio CN8 SDMMC_D0.
SDMMC IO	2019	ON	PC8 is connected to ST morpho CN12 pin 2 and Zio CN8 pin 2: SDMMC_D0 signal quality can be impacted.
PC8/PC9	SB22	OFF	PC9 is not connected to ST morpho CN12 pin 1 to avoid stub on Zio CN8 SDMMC_D1.
	3022	ON	PC9 is connected to ST morpho CN12 pin 1 and Zio CN8 pin 4. SDMMC_D1 signal quality can be impacted.
	SB63	OFF	PB0 is not used as OCTOSPI_IO1.
	3003	ON	PB0 is used as OCTOSPI_IO1.
ADC-A3/ OCTOSPI_IO1	SB64	OFF	PB0 is not connected to ARDUINO® A3
PB0		ON	PB0 is connected to ARDUINO® A3.
	SB65	OFF	PB0 is not connected to ST morpho pin 34.
		ON	PB0 is connected to ST morpho pin 34.
	0050	OFF	PA2 is not connected to Zio OCTOSPI_CS.
ADC-A1/OCTOSPI_CS	SB56	ON	PA2 is connected to Zio OCTOSPI_CS.
PA2	SB57	OFF	PA2 is not connected to ARDUINO® A1.
		ON	PA2 is connected to ARDUINO® A1.
ADC-A7/ VBUS_SENSE	SB53	OFF	PC2 is not connected to ADC_A7 on the Zio connector and is used as USB Type-C® VBUS_SENSE (SB6).
PC2	0200	ON	PC2 is connected to ADC_A7 on the Zio connector.
	0005	OFF	PA4 is not connected to Zio CN7 pin 9 for the SAI_D interface.
	SB35	ON	PA4 is connected to Zio CN7 pin 9 for the SAI_D interface.
	CD20	OFF	PA4 is not connected to Zio CN7 pin 17 for the SPI_B interface.
	SB38	ON	PA4 is connected to Zio CN7 pin 17 for the SPI_B interface.
	SB36	OFF	PB4 is not connected to Zio (CN7) for the SAI_D interface.
Zio SAI_D/SPI_B interface	3530	ON	PB4 is connected to Zio (CN7) for the SAI_D interface.
interface	CD42	OFF	PB4 is not connected to Zio (CN7) for the SPI_B interface.
	SB43	ON	PB4 is connected to Zio (CN7) for the SPI_B interface.
	0007	OFF	PB5 is not connected to Zio (CN7) for the SPI_B interface: Reserved for UCPD_DBCC1.
	SB37		PB5 is connected to Zio (CN7) for the SPI_B interface, shared with UCPD_DBn and UCPB_DBCC1.

UM2861 - Rev 10 page 39/52

Definition	Bridge	Setting ⁽¹⁾	Comment
	SB61	OFF	PB10 is not used as OCTOSPI_CLK.
OCTOSPI_CLK/ TIMER_C_PWM2		ON	PB10 is used as OCTOSPI_CLK.
PB10	SB62	OFF	PB10 is not used as a TIMER for motor control.
	3002	ON	PB10 is used as a TIMER for motor control.
TIMER_C_PWM1/ User button	SB60	OFF	PA0 is not used as a TIMER for motor control, reserved for the user button.
PA0	3600	ON	PA0 can be used as a TIMER for motor control, but cannot be used as a user button.
	SB66	OFF	PE15 is not used as OCTOSPI_IO3.
OCTOSPI_IO3/ TIMER A BKIN1	3600	ON	PE15 is used as OCTOSPI_IO3.
PE15	SB67	OFF	PE15 is not used as a TIMER for motor control.
		ON	PE15 is used as a TIMER for motor control.
	SB68	OFF	PE12 is not used as OCTOSPI_IO0.
OCTOSPI_IO0/ TIMER A PWM3N	SB08	ON	PE12 is used as OCTOSPI_IO0.
PE12	0.000	OFF	PE12 is not used as a TIMER for motor control.
	SB69	ON	PE12 is used as a TIMER for motor control.
	SB70	OFF	PE14 is not used as OCTOSPI_IO2.
OCTOSPI_IO2/ TIMER_A_BKIN2	3670	ON	PE14 is used as OCTOSPI_IO2.
PE14	SB71	OFF	PE14 is not used as a TIMER for motor control.
	35/1	ON	PE14 is used as a TIMER for motor control.

^{1.} The default configuration is in bold.

Note: The OCTOSPI interface is used in quad-mode communication without DQS to support Quad-SPI memories.

UM2861 - Rev 10 page 40/52

9 NUCLEO-U575ZI-Q and NUCLEO-U5A5ZJ-Q product information

9.1 Product marking

The product and each board composing the product are identified with one or several stickers. The stickers, located on the top or bottom side of each PCB, provide product information:

 Main board featuring the target device: product order code, product identification, serial number, and board reference with revision

Single-sticker example:

Product order code Product identification syywwxxxx MBxxxx-Variant-yzz

Dual-sticker example:

Product order code Product identification

and

MBxxxx-Variant-yzz syywwxxxxx

Other boards if any: board reference with revision and serial number.

Examples:

MBx

MBxxxx-Variant-yzz syywwxxxxx

or

or

On the main board sticker, the first line provides the product order code, and the second line the product identification.

On all board stickers, the line formatted as "MBxxxx-Variant-yzz" shows the board reference "MBxxxx", the mounting variant "Variant" when several exist (optional), the PCB revision "y", and the assembly revision "zz", for example B01. The other line shows the board serial number used for traceability.

Products and parts labeled as "ES" or "E" are not yet qualified or feature devices that are not yet qualified. STMicroelectronics disclaims any responsibility for consequences arising from their use. Under no circumstances will STMicroelectronics be liable for the customer's use of these engineering samples. Before deciding to use these engineering samples for qualification activities, contact STMicroelectronics' quality department.

"ES" or "E" marking examples of location:

- On the targeted STM32 that is soldered on the board (for an illustration of STM32 marking, refer to the STM32 datasheet *Package information* paragraph at the *www.st.com* website).
- Next to the ordering part number of the evaluation tool that is stuck, or silk-screen printed on the board.

Some boards feature a specific STM32 device version, which allows the operation of any bundled commercial stack/library available. This STM32 device shows a "U" marking option at the end of the standard part number and is not available for sales.

To use the same commercial stack in their applications, the developers might need to purchase a part number specific to this stack/library. The price of those part numbers includes the stack/library royalties.

UM2861 - Rev 10 page 41/52

9.2 NUCLEO-U575ZI-Q and NUCLEO-U5A5ZJ-Q product history

10 Federal Communications Commission (FCC) and ISED Canada Compliance Statements

10.1 FCC Compliance Statement

Part 15.19

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Part 15.21

Any changes or modifications to this equipment not expressly approved by STMicroelectronics may cause harmful interference and void the user's authority to operate this equipment.

Part 15.105

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instruction, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception which can be determined by turning the equipment off and on, the user is encouraged to try to correct interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Note: Use only shielded cables.

Responsible Party – U.S. Contact Information:

Francesco Doddo STMicroelectronics, Inc. 200 Summit Drive | Suite 405 | Burlington, MA 01803 USA

Telephone: +1 781-472-9634

UM2861 - Rev 10 page 44/52

10.2 ISED Compliance Statement

ISED Canada ICES-003 Compliance Label: CAN ICES-3 (B) / NMB-3 (B).

Étiquette de conformité à la NMB-003 d'ISDE Canada : CAN ICES-3 (B) / NMB-3 (B).

UM2861 - Rev 10 page 45/52

11 Product disposal

Disposal of this product: WEEE (Waste Electrical and Electronic Equipment)

(Applicable in Europe)

This symbol on the product, accessories, or accompanying documents indicates that the product and its electronic accessories should not be disposed of with household waste at the end of their working life.

To prevent possible harm to the environment and human health from uncontrolled waste disposal, please separate these items from other type of waste and recycle them responsibly to the designated collection point to promote the sustainable reuse of material resources.

Household users:

You should contact either the retailer where you buy the product or your local authority for further details of your nearest designated collection point.

Business users:

You should contact your dealer or supplier for further information.

UM2861 - Rev 10 page 46/52

Revision history

Table 23. Document revision history

Date	Revision	Changes
24-Jun-2021	1	Initial release.
13-Sep-2021	2	Added Product limitation to the NUU575ZIQ\$AT1 product identification and NUU575ZIQ\$AT2 product identification solving this limitation.
13-Apr-2022	3	Added Board MB1549-C03.
10-Αφι-2022	J	Updated Table 18 and Table 20 for the OCTOSPI interface.
		Added NUCLEO-U5A5ZJ-Q new product.
27-Jan-2023	4	Updated Hardware block diagram, Embedded STLINK-V3E with the former Figure 7 removed, Power supply and power selection, and STM32U5 Nucleo-144 board (MB1549) product information with new Table 21 and Table 22.
23-Feb-2023	5	Updated Table 16 titles. Removed CE conformity.
29-Mar-2023	6	Updated crystal characteristics in OSC clock sources.
10-Oct-2023	7	Updated ST morpho connector name in Bootloader.
31-Jan-2024	8	Updated Table 21 and Table 22 in NUCLEO-U575ZI-Q and NUCLEOU5A5ZJ-Q product information.
24-May-2024	9	Updated <i>Table 21</i> and <i>Table 22</i> regarding MCU silicon revisions, board versions and revisions, and board change descriptions.
10-Mar-2025	10	Updated Section 9.1: Product marking and Table 21. Product history. Added Section 5: Safety recommendations and Section 11: Product disposal.
